

## Risk Management: Identify Trouble Spots in the Transportation Chain

Whether importing, exporting or shipping domestically, damaged products can severely affect your company's bottom line. The first step to finding a solution is to identify the problem.

IOG Products' line of temperature and impact monitors and indicators can help identify and locate trouble spots in the transportation chain, in storage or while equipment is in use. All of which deter or reduce the incidence of mishandling.

As part of your risk management solution, The Digi-Shock GT, for example, can document all impact and temperature breaches throughout the entire transportation chain to help identify any trouble spots.

If you have ever had products damaged while in transit, then you'll know that finger-pointing is a common occurrence amongst manufacturers, distributors and carriers because risk ownership changes throughout the transportation chain.

IOG Products provides a solution to this by helping you identify who mishandled your product or equipment and when it was damaged. With this information documented, you can better manage the risk.
